

Elasticity of Demand

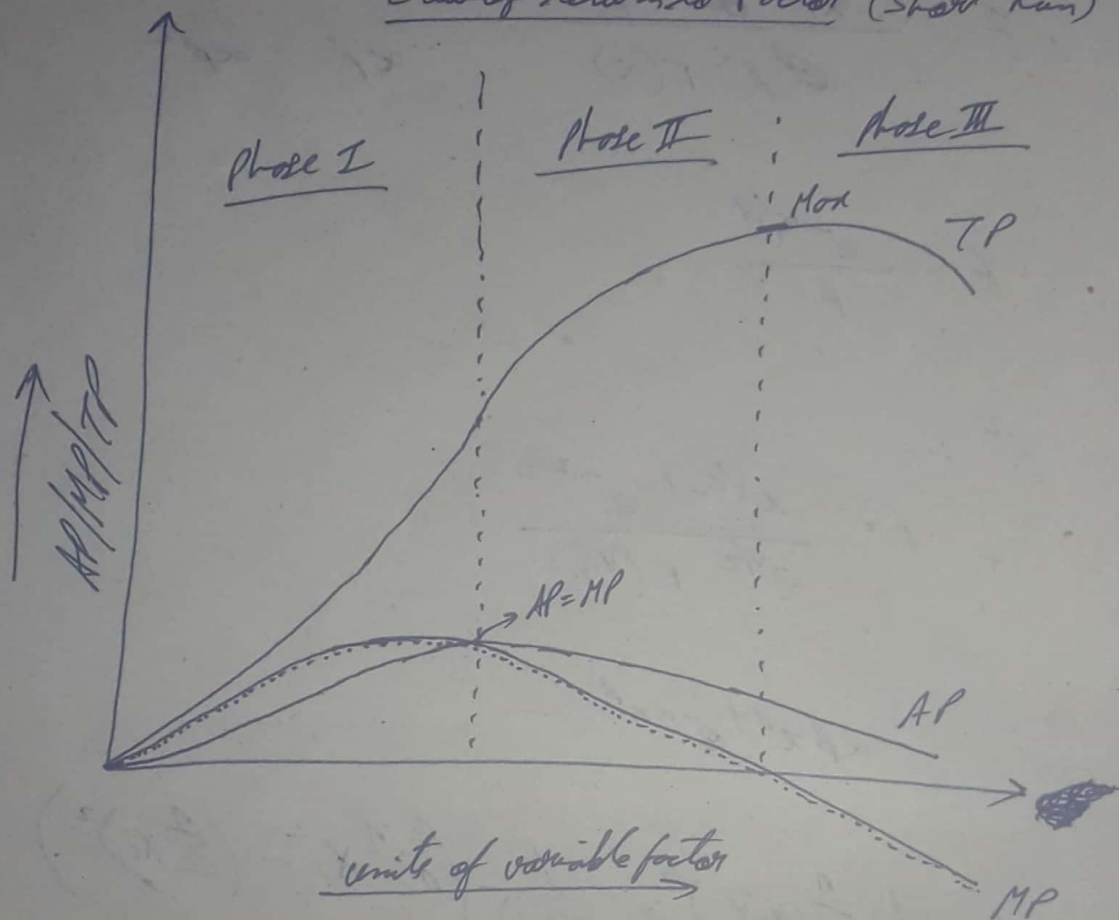

Total Expenditure & Elasticity of Demand

Production

Law of return to Factor (Short Run)

$$\text{Total prod.}^n = TP = AP + MP$$

$$\text{Avg Prod.}^n = AP = TP \div \text{units of var factor}$$

$$\text{Marginal Prod.}^n = MP_n = TP_n - TP_{n-1}$$

phase - I : increasing return to factor

phase - II : diminishing return to factor

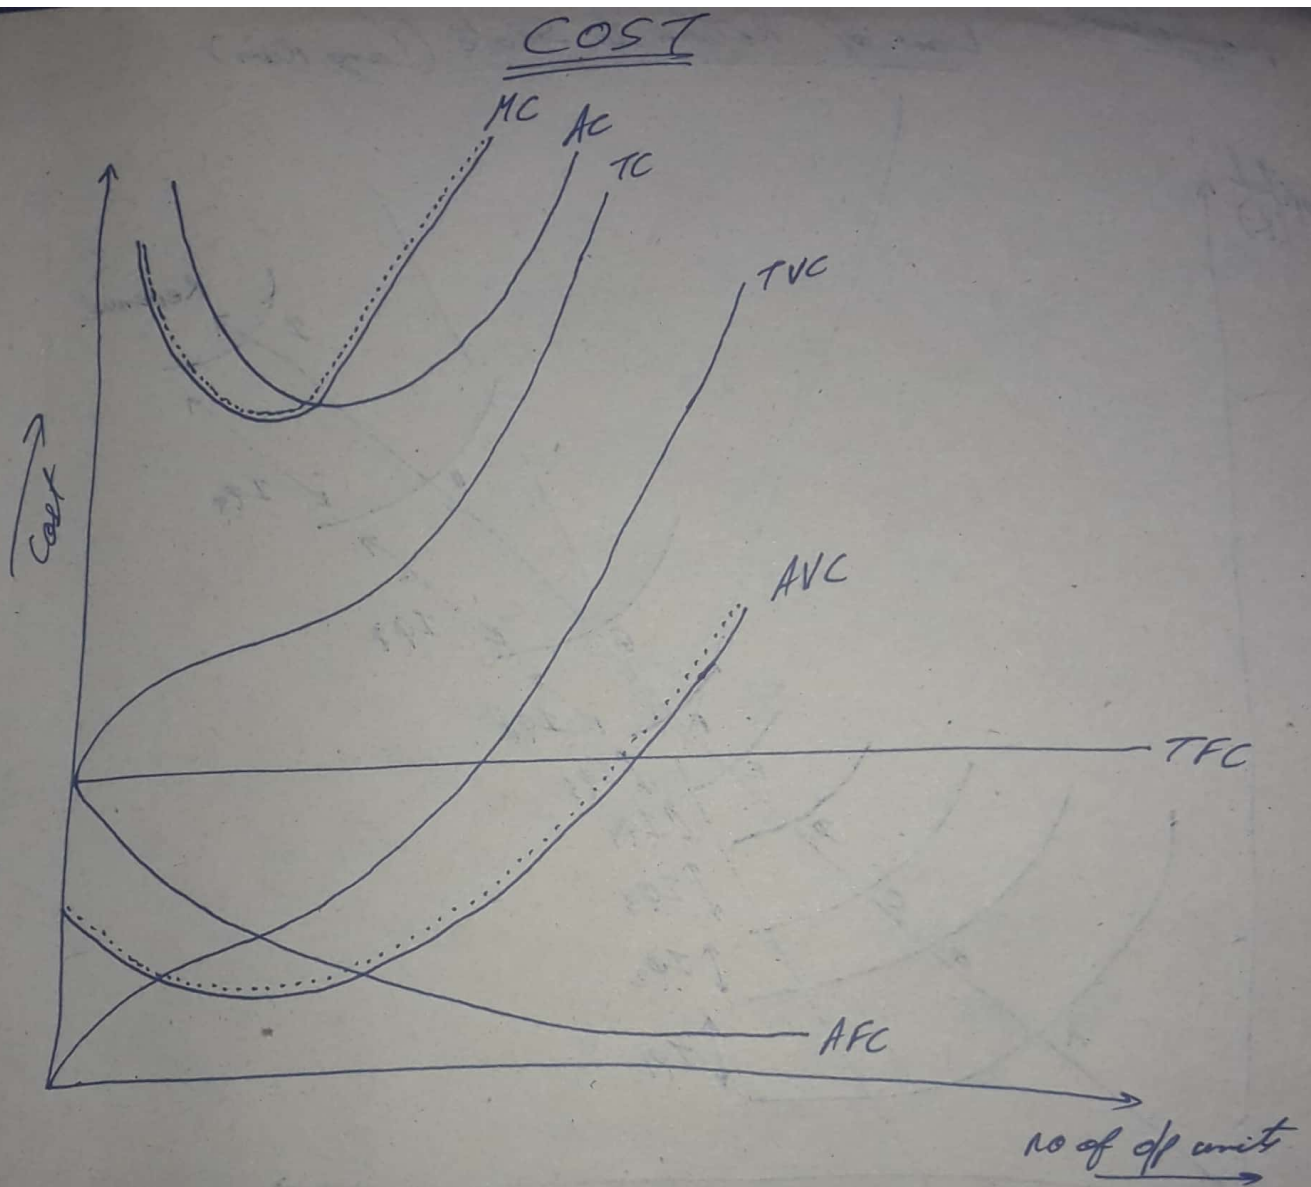

phase - III : negative return to factor

Production

Law of Return to Scale (Long Run)

increasing return
 $OA > AB > BC > CD$
 constant return
 $CD = DE = EF$
 diminishing return
 $FG < GH < HI$

where,

$$\text{Total fixed cost} = TFC = TC - TVC$$

$$\text{Total var. cost} = TVC = TC - TFC$$

$$\text{Total cost} = TC = TVC + TFC$$

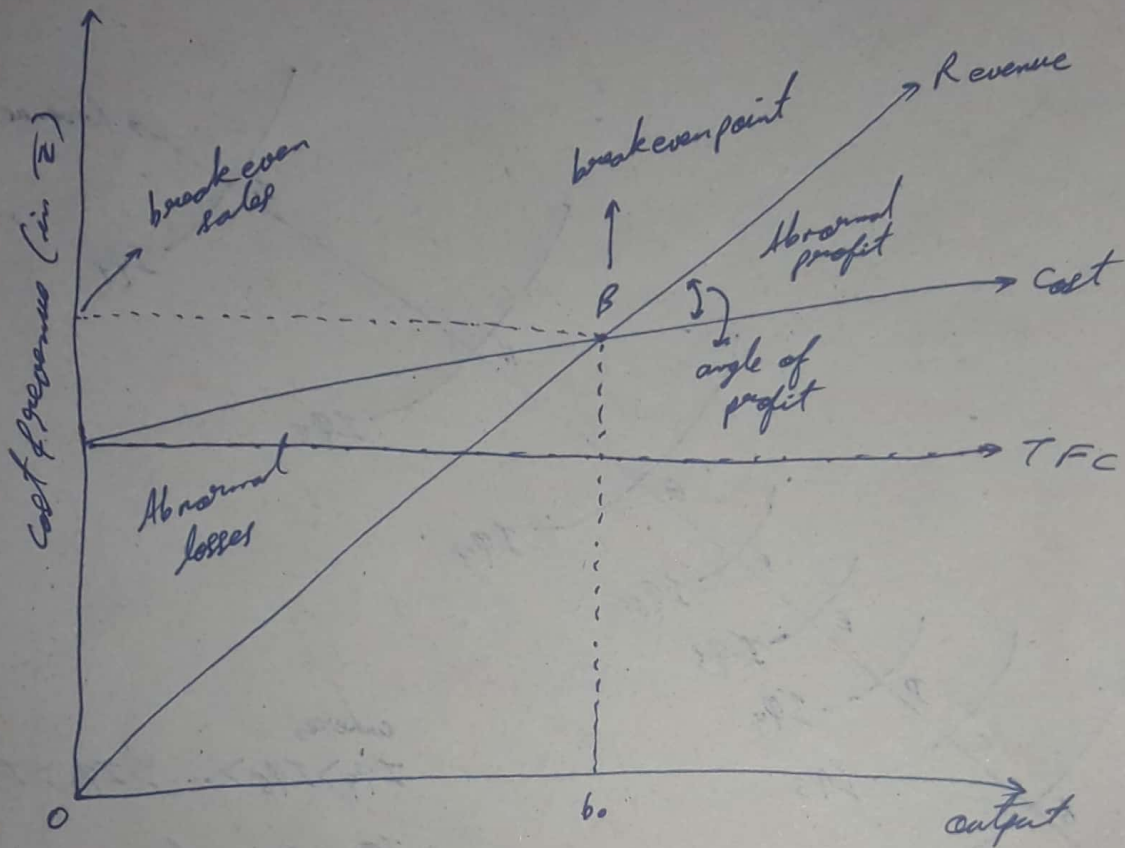

$$\text{Marginal cost} = MC_n = TC_n - TC_{n-1}$$

$$\text{Avg Fixed cost} = AFC = TFC \div o/p$$

$$\text{Avg var. cost} = AVC = TVC \div o/p$$

$$\text{Avg cost} = AC = TC \div o/p$$

Break-Even

$$\text{Total revenue (R)} = (\text{qty of o/p}) \times (\text{S.P. of each unit}) = nP$$

$$\text{Total profit (Z)} = \text{Revenue} - \text{Cost} = R - C$$

$$= n(P - V) - F$$

(V: var. cost)
(F: fixed cost)

$$\text{Cost (C)} = nV + F$$

At break even point, Z = 0

$$n = b_0 = \frac{F}{P - V}$$

$$\text{Contribution} = P - V$$

$$\text{break even sales} = b_0 P = \frac{PF}{P - V} = \frac{F}{1 - V/P}$$

$$\text{margin of safety} = \text{actual sales} - \text{break even sales}$$

$$= \frac{\text{profit} \times \text{sales}}{\text{contribution}}$$

$$\text{where profit} = \text{contribution} - \text{Fixed cost}$$
